

Device Maintenance Handbook

Maintenance Window

Gateway firmware maintenance is scheduled for Wednesday at 22:00 UTC. Operators confirm that the device has reported a healthy heartbeat within the previous fifteen minutes before starting an update.

Updates proceed in batches of ten devices. The operator pauses the rollout when more than one device in a batch fails its post-update health check.

Device Maintenance Handbook

Rollback and Verification

The previous signed firmware image remains available for rollback.

A rollback is required when a gateway cannot reconnect within five minutes or when telemetry validation reports an incompatible schema.

After maintenance, operators verify connectivity, clock synchronization, telemetry delivery, and the installed firmware version. The change record contains the affected device identifiers and the final outcome.
